### Split the data into training and testing

The train-test split is used to estimate the performance of machine learning algorithms that are applicable for prediction-based Algorithms/Applications. By default, the Test set is split into 30 % of actual data and the training set is split into 70% of the actual data.

```
In[18]:
          from sklearn.model selectionimport train test split
In[19]:
          x train, x test, y train, y test=train test split(x,y,test size=0.2,random state=0)
